

altairsim — Quick Reference

2026-09-23 · 3cb7346

Getting out, and back in

Key	Does
<code>^E</code>	STOP — stop the machine and take the keyboard back. Nothing is lost.
<code>RUN</code>	Resume, at the exact instruction it stopped on.
<code>QUIT</code>	Leave. (There is no <code>EXIT</code> .)

Editing the command line

`Tab` completes what you are typing — a command, then a board id, then its property names, then a property's values (`SET mem0 fill=` then `Tab`); a second `Tab` lists the choices. `Up` / `Down` walk the command history, saved per directory in `.altairsim_history`.

Key	Does
<code>Ctrl-A</code> / <code>Ctrl-E</code> (or <code>Home</code> / <code>End</code>)	start / end of line
<code>Alt-B</code> / <code>Alt-F</code> (or <code>Ctrl-Left</code> / <code>Ctrl-Right</code>)	back / forward one word
<code>Ctrl-W</code> / <code>Ctrl-K</code> / <code>Ctrl-U</code>	erase word behind / to end of line / whole line
<code>Backspace</code> / <code>Delete</code>	erase before / under the cursor

Command line

```
altairsim [options] [machine]
```

machine	a built-in name, or a config file (has a '/' or ends .toml). Omitted: ./altairsim.toml if there is one, else `default`.
-m, --machine <n>	ALWAYS a built-in name -- never a file.
-f, --file <path>	ALWAYS a file -- never a built-in name.
-n, --none	empty backplane: no boards, no memory, nothing.
-l, --list	list the built-in machines and exit.
-s, --script <f>	run a command script, then exit with its status.
-x, --exec <cmd>	run one monitor command (repeatable), then exit.
-i, --interactive	after --script/--exec, stay in the monitor.
--mcp	MCP server on stdio.
-v, --version	print the version and exit.
-h, --help	print this help and exit.

Monitor commands

Type the part before the bracket.

Command	Does	Usage
B0[ARDS]	List, add, or remove boards on the backplane.	BOARDS [LIST] ADD <type> <id> [k=v...] REMOVE <id>
B[REAK]	Set a breakpoint on an address, memory/I/O access, or tape stop.	BREAK [<addr> MEM R W <addr> IO R W <port> TAPE STOP] [IF <expr> LOADS <expr>] [TRACE ON OFF]
COM[PARE]	Compare a range of memory against another address.	COMPARE <range> <addr>
C[ONFIG]	Load or save the whole machine as a TOML file.	CONFIG LOAD <f.toml> CONFIG SAVE <f.toml>
CONN[ECT]	Attach a serial unit to an endpoint (console, socket, file, ...).	CONNECT <id>:<u> <endpoint>
CONS[OLE]	Show or set the host console's properties.	CONSOLE [<k>=<v>...]
DE[POSIT]	Write bytes into memory at an address.	DEPOSIT <addr> <bytes...>
DI[SASM]	Disassemble memory into instructions.	DISASM [<addr> <range>] [n] [CPU=8080]
DISC[ONNECT]	Unplug the endpoint from a serial unit.	DISCONNECT <id>:<u>
D0	Run a file of monitor commands, one per line, as if typed.	D0 <file>
D[UMP]	Show memory as hex and ASCII.	DUMP [<addr> <range>] [WIDTH=16]
E[DIT]	Enter bytes into memory interactively from an address.	EDIT <addr> [ROM]
EX[AMINE]	Point the front panel at an address (and show that byte).	EXAMINE [<addr>]
F[ILL]	Fill a range of memory with a byte.	FILL <range> <byte>
HE[LP]	Show help for a command.	HELP [<command>]
H[ISTORY]	Replay the recent instruction (or bus-cycle) history.	HISTORY [BUS CPU] [n]
I[N]	Read a byte from an I/O port.	IN <port>

L[OAD]	Load a file into memory (binary, Intel hex or S-record).	LOAD <file> [AT <addr>] [FORMAT=BIN HEX SREC] [ROM]
MA[CHINE]	Load a built-in machine by name (MACHINE none empties the backplane).	MACHINE <name> MACHINE none
M[OUNT]	Put a disk or tape image into a drive; a .imd is converted to a raw .dsk beside it.	MOUNT <id>[:<u>] <file> [WP] [CREATE] [extract[=<base>]] [k=v...]
MOV[E]	Copy a range of memory to another address.	MOVE <range> <dest> [ROM]
N[EXT]	Step one instruction, running any CALL/RST to completion.	NEXT
NO[BREAK]	Remove a breakpoint, or all of them.	NOBREAK [id]
O[UT]	Write a byte to an I/O port.	OUT <port> <byte>
P[OWER]	Power-cycle the machine -- the only thing that clears RAM.	POWER

Q[UIT]	Leave the simulator.	QUIT
REGI[ON]	Add a RAM or ROM region to a memory board.	REGION ADD <id> type=ram rom at=<addr> [size= mount=]
RE[GS]	Show the CPU registers (SET REG changes one).	REGS SET REG <r>=<v>
RES[ET]	Reset the machine, keeping RAM (RESET CPU resets just the processor).	RESET [CPU]
REST[ORE]	Load machine state back from a snapshot.	RESTORE <file>
R[UN]	Start or resume the machine, optionally at an address.	RUN [addr]
SA[VE]	Write a range of memory out to a file.	SAVE <file> <range> [FORMAT=BIN HEX OCTAL PRN]
SEA[RCH]	Find bytes or a string in a range of memory.	SEARCH <range> <bytes...> "str"

SE[T]	Change a property of a board, the console, display, a register, the bus, or the machine.	SET <id>[:<u>] CONSOLE DISPLAY TERMINAL MACHINE REG BUS <k>=<v>
SH[OW]	Display the state of a board, the bus, or the machine.	SHOW <id> BOARDS BOARD <type> [UNITS] MACHINES MACHINE [<name>] BUS [MAP IO IRQ CONTENTION] ROMS MOUNTS PATHS CONSOLE DISPLAY SYMBOLS CLOCK VERSION
SN[APSHOT]	Save the whole machine state to a file.	SNAPSHOT <file>
STA[RTUP]	Edit the machine's boot list (the commands CONFIG SAVE writes as startup = [...]).	STARTUP [ADD <command> REMOVE <n> CLEAR]
S[TEP]	Run one instruction (or n), showing the registers after each.	STEP [n]
SY[MBOLS]	Load or clear a symbol table for disassembly.	SYMBOLS LOAD <file> [REPLACE] SYMBOLS CLEAR
T[RACE]	Log every bus cycle while the machine runs.	TRACE ON OFF [file] [MASK=IN,OUT,IRQ,DMA,CONTENTION]

TY[PE]	Feed text to the guest as if typed at its keyboard.	TYPE "text"
U[NMOUNT]	Take a disk or tape out of a drive.	UNMOUNT <id>:<u>
W[H0]	Say which board answers an address or I/O port.	WHO <addr> WHO IO <port>

Boards

CPU

Type	What it is
8080	MITS 88-CPU: an 8080A at 2 MHz. Decodes nothing -- it drives the bus
8085	Generic 8085 CPU board. Decodes nothing -- it drives the bus. The 88-CPU's twin, with an 8085 core (RIM/SIM + TRAP/RST 5.5/6.5/7.5)
z80	Generic Z80 CPU board. Decodes nothing -- it drives the bus. The 88-CPU's twin, with a Z80 core

Memory

Type	What it is
bankmem	S-100 bank-switched RAM. One card, four decoders (card=vector cromemco64kz northstar expandoram2): a write-only select port swaps which RAM plane(s) drive the bus. Each card owns its own decode -- one-hot select (Vector 40), 8-bit bank mask (Cromemco 40), on/off+one-hot toggle (North Star C0), or PROM page-select (ExpandoRAM II FF, approximated)
memory	RAM/ROM board: a list of regions and PHANTOM* -- plain, unbanked memory (bank switching is its own board, bankmem)
v2z80rom	S100Computers V2 Z80 CPU board -- its onboard paged monitor EEPROM (the Z80 itself is board 'z80cpu'). An 8K 28C64 at F000-FFFF holding two 4K pages, builtin:master0 (low) / master1 (high), selected by OUT D3H bit1 (bit0=1 inactivates the EEPROM so RAM shows through). Shadows RAM in its window while enabled. Cold-start the MASTER monitor with startup=["RUN F000"]; the 'T' command boots CP/M 3 off a dualsd card

Disk

Type	What it is
16fdc	Cromemco 16FDC: WD FD1793 soft-sector floppy (single + double density), up to 4 drives. Disk registers at 30-34, a TMS 5501 console UART at 00-09 (unit 'tty'), and a 4K RDOS 2.52 boot PROM at C000 (OUT 40H banks it out, RESET restores it). Boots CDOS
64fdc	Cromemco 64FDC: the 16FDC's 1983 successor -- same FD1793 + TMS 5501, carrying an 8K RDOS 3.12 boot PROM at C000-DFFF (OUT 40H banks it out, RESET restores it). Boots CDOS
dcdd	MIT 88-DCDD: 8" hard-sector floppy, up to 16 drives. Three ports at BASE+0..2. INVERTED status bits
dualide	S100Computers IDE-AB (CF): the IDE/CompactFlash half of the IDE+ESP32 combination board -- two CF sockets (drives 0/1 = A:/B:) for CP/M 3. Five 8255 ports at BASE+0..4 (default 30): A/B data, C control lines, mode config, drive select. Programmed-I/O ATA register engine (LBA read/write, 512-byte sectors). No boot PROM -- the CPU board's monitor boots CP/M from the CF. Mounts the SAME card image as dualsd (a .img with a .geo geometry sidecar); pair with dualsd for the full A:/B:+C:/D: system
dualsd	S100Computers Dual SD: two microSD sockets (drives 0/1) presented as raw 512-byte-sector CF/SD cards, for CP/M 3. Two ports at BASE+0..1 (default 80): status/command + data. Programmed-I/O command/handshake engine (33H-lead + 8 commands). No boot PROM -- the CPU board's monitor loads CP/M from track 0. Mount a card image (a .img with a .geo geometry sidecar)
hdsk	MIT 88-HDSK Datakeeper: Pertec hard disk, 256-byte sectors from a linear .DSK. Eight ports at BASE+0..7 (default A0). Command/handshake protocol, four page buffers
icom	iCOM FD3712/FD3812 8" floppy: a programmed-I/O command/handshake controller on the S-100 Interface board. Two ports at BASE+0..1 (default C0) plus a boot PROM and 6810 scratch RAM in high memory (rom=builtin:icom-fd3712-cpm icom-fd3712-fdos icom-fd3812-cpm). Boots CP/M 2.2 (single and double density) and FDOS. Up to 4 drives
mds	MIT 88-MDS: 5.25" minidisk, 4 drives. Same three ports as the dcdd -- but 300 RPM, 64 us/byte, and a motor that stops after 6.4 s
tarbell	Tarbell #1011: single-density WD FD1771 floppy, up to 4 drives. Eight ports at BASE+0..7 (default F8). Carries a 32-byte boot PROM that shadows 0000 over PHANTOM* -- boots CP/M automatically at reset (bootstrap=on)
tarbelldd	Tarbell #2022: double-density WD FD1791 floppy (mixed-density media, SD track 0), up to 4 drives. The single-density card's twin with a bitmap OUT-FC latch and a port-FD DMA/ext-addr register. Same 32-byte boot PROM
versafloppy	SD Systems VersaFloppy I/II: WD FD177x soft-sector floppy, up to 4 drives. Eight ports at BASE+0..7 (default 60). variant=vfi (FD1771, single density) vfii (FD1791, single+double). Boots SDOS with the SBC-200 + DDBIOS

Serial

Type	What it is
2sio	MIT S 88-2SIO: two 6850 ACIAs, units 'a' and 'b'. Four ports at BASE+0..3
gsio	Generic SIO: a strap-configurable serial board with TWO independent channels, units 'a' and 'b' (configure each under [board.unit.a] / [board.unit.b]). Basic transmit/receive only -- no programmable word length, parity, stop bits or framing/overflow status; a specific card that needs those is a separate emulated board. Per channel you strap: a status/control port (status_port -- read synthesizes DAV/TBMT at bit positions you pick, write is discarded) and a data port (data_port); one inverter_gate knob inverts both status bits together. Built-in profiles preset the straps: profile=sior0 (MIT SIO Rev 0, the default) tuart (Cromemco TU-ART) imsai-sio2 compupro-if2 (CompuPro Interfacer II) compupro-ss1 (CompuPro System Support 1). Channel a defaults to ports 0/1, b to 2/3. Polled, no interrupts. CONNECT each channel to a file, socket, serial port, in:/out:
io4	SSM IO-4 (2P+2S): the real Solid State Music board -- two full-duplex serial channels AND a four-port parallel section. Serial units 'a'/'b' are real 1602-family UARTs with programmable word length (data_bits 5-8), parity and stop bits (unlike the generic gsio), plus the full status-word strap-up (stat_* map, invert_status, port_reversal) and named profiles (default altair-rev1). A 4-port block set by switch S3 (default 0-3): Serial A status/data at BASE+0/+1, Serial B at BASE+2/+3. Parallel units 'pa'/'pb' are 8212 latched ports (input latch + service request, output latch) on their own 2-port block set by switch S4 (par_port, default 4-5): Parallel A at PAR+0, B at PAR+1; a byte the far end sends is strobed in, a write latches out, and the §3.2.2 status/data console flag is strappable (dav_bit/dav_source/dav_active_low). If the two blocks overlap, neither section answers the shared ports. Each serial channel's receive (DAV) and transmit (TBMT) and each parallel input (service request) can raise an interrupt, strapped on header W4 to a VI line, pin 73 (int), or none (rx_int/tx_int per serial channel, int per parallel port) -- there is no software enable, the strap is the enable, and a parallel input interrupt rises even when the port is not addressed. Configure each unit under [board.unit.a] / [board.unit.pa] etc.; CONNECT each to a file, socket, serial port, in:/out:
pmmi	PMMI MM-103: Bell 103 modem on an S-100 card, unit 'line'. Four ports at BASE+0..3 (default C0), read/write different registers. Transmit/receive over a ByteStream; CONNECT it to in:/out: files. No dialer; modem status is a fixed stub
propio	S100Computers Console IO Board (Parallax-Propeller console), unit 'serial'. A strap-configurable serial subtype preset to the board's documented convention: status/data at 00/01, RX-ready = status bit 1, TX-ready = status bit 2, both active high. Every strap (status_port/data_port/dav/tbmt/inverter_gate) is still overridable -- the real board is jumpered. Polled, no interrupts. CONNECT it to a file, socket, serial port, in:/out:
sbc	SD Systems SBC-100/200: Z80 single-board computer. One 8-port block (78-7F): Intel 8251 console (unit 'tty', data 7C / status 7D, RxD->/DSR auto-baud for MSMONR21), Z80-CTC (78-7B) whose ch1 raises a mode-2 keyboard interrupt (vector 0x82) off the 8251 RxRDY, and a parallel port (7E/7F) whose OUT 7F bit 1 switches the onboard PROM out. Optional onboard boot PROM via [[board.socket]] (at+mount). variant=sbc100 sbc200
sio	MIT S 88-SIO: one COM2502 UART, unit 'tty'. Two ports at BASE+0..1. INVERTED status bits
turnkey	MIT S 8800b Turnkey Module: phantom boot PROM (FC00-FFFF), integrated 6850 SIO (unit 'tty', default 0x10), sense switches at FF, and the Auto-Start JMP jam. Sockets via [[board.socket]]

Tape

Type	What it is
acr	MIT 88-ACR: cassette. An 88-SIO B + an FSK modem, unit 'tape'. Brings the WIND/REWIND/EXTRACT verbs and a tape counter
uio	MIT 88-UIO: serial + cassette on one board. A 6850 (unit 'serial', default 0x10) and an 88-ACR cassette section (unit 'tape', default 0x06) with motor control and a SW-1 MIT/Kansas-City modulation switch. Defaults reproduce the standard 0x10 + 0x06 layout

Parallel and printer

Type	What it is
4pio	MIT 88-4PIO: up to four 6820 PIAs, sections ja/jb.. per port. 16 ports from BASE (default 20). Software-set direction; CONNECT each section
c700	MIT 88-C700: Centronics line-printer controller, unit 'prn'. Two ports at BASE+0..1 (default 02). Output-only; CONNECT it to a file, a socket, or a real printer queue
d7a	Cromemco D+7A: analog + parallel I/O. Eight ports from BASE (default 18): one parallel port + seven two's-complement A/D-in/D/A-out channels. Reads 1-2 JS-1 joysticks from the host
lpc	MIT 88-LPC: 88-LP line-printer controller, unit 'prn'. Two ports at BASE+0..1 (default 02). Line-buffered: 6-bit codes + PRINT/LINE FEED/CLEAR. CONNECT it to a file, a socket, or a real printer queue
pio	MIT 88-PIO: 8-bit parallel port, units 'out'/'in'. Two ports at BASE+0..1 (default 04). CONNECT a printer, a keyboard, a socket

Video

Type	What it is
dazzler	Cromemco Dazzler: color graphics from a framebuffer in main RAM. Two ports at BASE+0..1 (default 0E): control/status and format. 32x32 to 128x128, 16 colors/greys. Needs a Display
vdb8024	SD Systems VDB-8024: an 80x24 video terminal on one board -- the video console for an SBC-100/200 (the alternative to the 8251). Two I/O ports at BASE+0..1 (default 00): status/keyboard/display. Unit 'keyboard' (CONNECT). Optional keyboard-strobe interrupt strap (interrupt=vi0..vi7) for the SBC-200's CTC to vector - what the SD video CBIOS needs; polled by default. Boots sdmonv21. Needs a Display
vdm1	Processor Technology VDM-1: memory-mapped 16x64 video, screen RAM at BASE (default CC00), scroll/status port (default CC). Needs a Display

Systems

Type	What it is
<code>sol</code>	Processor Technology Sol-PC I/O: serial, keyboard, parallel, CUTS tape as one board. Seven ports F8..FE. Units serial/printer/keyboard (CONNECT) and tape1/tape2 (MOUNT). Brings the WIND/REWIND/EXTRACT verbs and a tape counter

PROM programmer

Type	What it is
<code>pb1</code>	SSM PB1: 2708/2716 EPROM programmer + on-board EPROM board. A 4K programming-socket window (default D000, sockets U22=2708/U23=2716) and one control port (default 10): OUT arms the board and picks the chip (D0=2708, D1=2716), then a window write burns a byte and a window read disarms it. Save the burn to a host hex file with <code>SAVE file window</code> . Optional read-only on-board EPROM area via <code>[[board.prom]]</code> (at + mount). The board ships no firmware -- run any 2708/2716 burner; SSM's own from the PB1 manual is in <code>examples/pb1</code>

Other

Type	What it is
<code>fp</code>	Altair front panel: the SENSE switches a guest reads at IN 0FFH -- a configured byte (SET fp0 sense= or TOML), not toggled here. No OUT
<code>hostbridge</code>	Host Bridge: guest <-> host file transfer, sandboxed. OUR OWN BOARD, not a period one. Two ports at BASE+0..1. R.COM/W.COM/HDIR.COM
<code>rtc100</code>	SciTronics RTC-100: an S-100 battery-backed real-time clock/calendar (OKI MSM5832) behind a 6821 PIA. Four consecutive ports from a base that must be a multiple of 4 (port A data/direction at base+0 -- digit address in the low nibble, digit data in the HIGH nibble on a read; port A control at base+1 -- CA2 is the clock's Hold, low = stopped; port B at base+2 -- bit 0 is the Write strobe; port B control at base+3 -- CB2 is the Read line). Keeps time from the host, battery-backed across RESET, and settable by the guest. Optional once-a-second interrupt on pin 73, vectored by the card itself with RST 0-7 (the <code>restart</code> switch)
<code>ss1</code>	CompuPro System Support 1: multifunction S-100 board. Dual 8259A interrupt controllers in a master/slave cascade (master/slave at base+0..+3; master watches VI0-6 and drives pin 73, slave takes the timer OUTs and the UART's Rx/TxRDY), an 8253 interval timer (three counters + control at base+4..+7, 2 MHz clock), the OKI MSM5832 battery-backed real-time clock/calendar (command/data at base+10/+11) and a 2651 UART serial channel (base+12..+15); base default 50H. The 9511/9512 math socket is unpopulated
<code>virtc</code>	MITS 88-VI/RTC: vectored interrupts (VI0-VI7 -> RST n) and a real-time clock. One port at FE

Machines

Machine	What it is
8085	A minimal 8085 machine: an 8085 CPU, 64K of RAM, and a 2SIO console.
acuter	ACUTER at F000 -- CUTER on a plain Altair, with a terminal instead of a VDM.
altmon	An Altair with a monitor in ROM and a terminal on it.
amon	AMON 3.1 in a 4K EPROM at F000 -- Martin Eberhard's full-featured Altair monitor.
bankmem	A bank-switched RAM machine: a Z80, a console, and a Vector Graphic 64K bankmem.
basic4k	The machine Altair 4K BASIC was sold to run on: an 88-SIO Teletype, a cassette in the ACR.
basic8k	The machine Altair 8K BASIC was sold to run on: an 88-2SIO terminal, a cassette in the ACR.
cdbl	The default machine with the Combo Disk Boot Loader in the PROM socket.
compupro	A stock Altair with a CompuPro System Support 1 board for its clock/calendar.
cuter	CUTER 1.3 driving a Processor Technology VDM-1 -- the real Sol/CUTS monitor.
dazzler	A Cromemco Dazzler in an Altair -- the bench for the S-100's first color graphics card.
default	The machine you get when you name none: 56K, and the DBL boot PROM at FF00.
dualide	S100Computers "IDE-AB CF" machine -- a V2 Z80 CPU board booting CP/M 3 off a CompactFlash card.
dualidesd	S100Computers "IDE-AB CF+ESP32" machine -- both boards, CP/M 3 on CF drives A:/B: and SD drives C:/D:.
dualsd	S100Computers "Dual SD" machine -- a V2 Z80 CPU board booting CP/M 3 off a microSD card.
icom	iCOM FD3712 8" floppy machine -- boots CP/M 2.2 off a single-density iCOM disk.
lineprinter-lpc	The default machine with an 88-LPC line printer at port 02; CONNECT <code>lpt0:prn</code> to a file or the console.
lineprinter	The default machine with an 88-C700 line printer at port 02; CONNECT <code>lpt0:prn</code> to a file or the console.
minidisk	The Altair Minidisk: an 88-MDS at 08 and the MDBL boot PROM. You supply the 5.25" disk.
original	The Altair as it actually left Albuquerque.
parallel	The default machine with two MITS parallel boards: an 88-PIO and an 88-4PIO.
ps2	The machine MITS Programming System II ran on: basic8k's cards, but not basic8k's bootstrap.
ps2int	MITS Programming System II, WITH INTERRUPTS. ps2 with A9 down and an 88-VI/RTC in it.
rombasic	MITS Extended ROM BASIC 16K -- Extended BASIC that runs directly out of ROM.
sbc200	SD Systems SBC-200 -- a 4 MHz Z80 single-board computer running the MSMONR21 monitor.

sbc200v	The SD Systems SBC-200 with a VDB-8024 VIDEO console: SDMONV21 on an 80x24 screen.
sol20	The Processor Technology Sol-20 -- an integrated 8080 machine, running SOLOS.
tarbell	Tarbell #1011 single-density floppy machine -- boots CP/M 2.2 the moment a disk is in it.
tarbelldd	Tarbell #2022 double-density floppy machine -- boots CP/M 2.2 the moment a disk is in it.
turnkey	The MITS 8800bt -- an Altair with a Turnkey Module where the front panel used to be.
vdm1	A Processor Technology VDM-1 in an Altair, and a demo that draws on it.
z80	A minimal Z80 machine: a z80 CPU, 64K of RAM, and a 2SIO console.

A machine file, in one look

```
[machine]
name      = "mine"
base      = "default"      # start from a machine, and say what is DIFFERENT
startup   = ["RUN FF00"]    # the operator's own keystrokes. There is no BOOT verb.

[[board]]                # type + a NEW id      -> ADD the card
type       = "2sio"        # type + an id from the base -> REPLACE it outright
id         = "sio0"        # NO type + an id      -> MODIFY the one already there
port       = 10            # remove = true       -> PULL THE CARD OUT

[board.unit.a]            # a unit's own settings
connect    = "console"

[[board.region]]          # a list the card owns (memory)
type       = "ram"
at         = 0000          # hex: it is an address
size       = "56K"         # decimal: it is a size

[[board.drive]]           # a list the card owns (disk controllers)
unit       = 0
mount      = "cpm.dsk"     # relative to THIS FILE

[console]                 # the HOST's terminal -- not a board
strip7out  = true
base       = octal         # read/print the wire class in split octal (MITS style)
```

Paths: a path *inside* a machine file is relative to **that file**. A path you *type* is relative to **your shell**.

Endpoints — `CONNECT <id>:<unit> <endpoint>`

Endpoint	Is
<code>console</code>	the host terminal. Exactly one unit may hold it.
<code>null</code>	nowhere. Writes vanish, reads never come.
<code>loopback</code>	itself — what you write comes back.
<code>scripted</code>	a caller in place of a human — what MCP and the tests type into.
<code>socket:PORT</code>	listens , as a raw pipe — for a program at the far end. <code>?banner</code> greets each caller.
<code>socket:HOST:PORT</code>	calls out , as a raw pipe.
<code>telnet:PORT</code>	listens , speaking Telnet — this is telnet-in for a person. Greets each caller; <code>?banner=off</code> stops it.
<code>telnet:HOST:PORT</code>	calls out , taking the telnet client's part.
<code>serial:DEVICE</code>	a real serial port on this host.
<code>in:PATH</code>	a host file as a reader (paper tape). <code>?cps=N</code> paces it.
<code>out:PATH</code>	a host file as a punch — 8-bit clean, never truncating.
<code>terminal</code>	a window the simulator draws itself (SDL builds). <code>?emulation=vt100 adm3a vt52 h19</code> , <code>?size=COLSxROWS</code> .
<code>printer:QUEUE</code>	a real print queue on this host.
<code><endpoint> FILE</code>	a tap: append <code> FILE</code> to any endpoint to also log the line.
<code><endpoint> socket:PORT</code>	a live mirror: <code>telnet</code> in to watch and take over. <code>?ro</code> = watch-only.
